

High voltage ignition coil driver power integrated circuit

Features

Type	V _{cl}	I _{cl}	I _{cc}
VB525SP-E	380 V	10 A	150 mA

- ECOPACK®: lead free and RoHS compliant
- Primary coil voltage internally set
- Coil current limit internally set
- Logic level compatible input
- Driving current quasi proportional to collector current
- Single flag on coil current
- Low voltage clamp thermal shutdown

Description

The VB525SP-E is a high voltage power integrated circuit made using the STMicroelectronics™ VIPower™ M1-3 technology, with Darlington and logic level compatible vertical current flow power driving circuit.

The enable pin allows to externally block the switch when the input is on. A built-in protection circuit for coil current limiting and collector voltage clamping allows the device to be used as a smart, high voltage, high current interface in advanced electronic ignition systems. If the input signal from the microcontroller happens to remain high, the device protects itself against overheating by forcing collector current to smoothly decrease (low voltage clamp feature) to avoid undesired spark.

2.1 Absolute maximum rating

Stressing the device above the ratings listed in the “Absolute maximum ratings” tables may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

4.1 Principle of operation

The VB525SP-E is mainly intended as a high voltage power switch device driven by a logic level input and interfaces directly to a high energy electronic ignition coil.

The input V_{IN} of the VB525SP-E is fed from a low power signal generated by an external controller that determines both dwell time and ignition point. During V_{IN} high (≥ 4 V) the VB525SP-E increases current in the coil to the desired, internally set current level.

After reaching this level, the coil current remains constant until the ignition point, that corresponds to the transition of V_{IN} from high to low (typ. 1.9 V threshold).

During the coil current switch-off, the primary voltage HV_C is clamped at an internally set value V_{cl} , typically 380 V. The transition from saturation to desaturation, coil current limiting phase, must have the ability to accommodate an overvoltage.

A maximum overshoot of 20 V is allowed.

4.2 Feedback

When the collector current exceeds 4.5 A, the feedback signal is turned high and it remains so, until the input voltage is turned-off.

4.3 Overvoltage

The VB525SP-E can withstand the following transients of the battery line:

- -100 V / 2 msec ($R_i = 10\ \Omega$)
- +100 V / 0.2 msec ($R_i = 10\ \Omega$)
- +50 V / 400 msec ($R_i = 4.2\ \Omega$, with $V_{IN} = 3\text{ V}$)
